Group Chairman's Report of Investigation
Wake Vortex Flight Test

NATIONAL TRANSPORTATION SAFETY BOARD

Office of Research and Engineering
Washington, D.C.

November 9, 1995

Group Chairman's Report of Investigation - Wake Vortex Flight Test

A. ACCIDENT DCA-94-MA-076

Location : Aliquippa, Pennsylvania
Date : September 8, 1994
Time : 1904 Eastern Daylight Time
Aircraft : Boeing 737-300, N513AU

B. GROUP IDENTIFICATION

The Aircraft Performance Group met at the Federal Aviation Administration's (FAA) Technical Center at the Atlantic City International Airport from September 25 through October 1, 1995. The following group members participated in this investigative effort:

Chairman : Thomas R. Jacky, NTSB
Member : Bob McCullough, USAir
Member : Keakini Kaulia, ALPA
Member : James Kerrigan, Boeing

Additionally, the following persons assisted the group during the investigative effort:

Martin Ingham, Boeing
James Wilborn, Boeing
Sarah Lewis, Boeing
Mike Carriker, Boeing
Les Berven, FAA
John Cox, ALPA
Jim Gibbs, USAir
Keith Beihl, FAA

C. SUMMARY

On September 8, 1994 at 1904 Eastern Daylight Time, USAir Flight 427, a Boeing 737-3B7, N513AU, crashed while maneuvering to land at Pittsburgh International Airport, Pittsburgh, Pennsylvania. The airplane was being operated on an instrument flight rules (IFR) flight plan under the provisions of Title 14, code of Federal Regulation (CFR), Part 121, on a regularly scheduled flight from

Chicago O'Hare International Airport, Chicago, Illinois, to Pittsburgh. The airplane was destroyed by impact forces and fire near Aliquippa, Pennsylvania. All 132 persons on board the airplane were fatally injured.

D. **DETAILS OF INVESTIGATION**

1. **General Details**

The Aircraft Performance Group conducted a Wake Vortex Flight Test at the FAA's Technical Center at the Atlantic City Airport from September 25 through October 1, 1995. The objectives of the test were the following:

1. Determine effects of 727 wake vortices on 737-300 aerodynamics;
2. Additional measurement of strength and behavior of 727 wake;
3. Cockpit Voice Recorder (CVR) Sound Spectrum Group support;
4. Systems Group and future test support.

For the test, a 737-300, N533AU, was leased from USAir. The FAA donated the use of a Boeing 727-100, based at the Technical Center, for the test. The 727-100, outfitted with wingtip smoke generators to mark its wake, was the wake generator, while the B-737 was the wake penetrating airplane. Additionally, a T-33 airplane, contributed by Boeing, was a safety chase airplane for the B-737 throughout the tests. The National Aeronautics and Space Administration's OV-10A airplane, used for meteorological measurements, was used in support of the test during two flights. An additional flight with the 727 and OV-10A was flown on October 2, 1995, after the 737 departed Atlantic City.

During the test, eight flights were conducted in which data were collected. One or two flights were flown per day. The flights were typically conducted in early morning hours, immediately after sunrise. Flights were conducted at that time in order to locate atmospheric conditions leading to strong and stable vortices. A daily summary of the flight test is included in Attachment 1.

2. **Flight Test Data Recording**

In order to measure and document the wake encounters, several modifications were accomplished on the 737. Most of the modifications were done in order to better measure the airplane's aerodynamic parameters. A summary of 737 modifications is included in Attachment 2.

The USAir 737 used for the flight test contained an FDR recording system that recorded approximately thirty parameters, more than the accident airplane. For the wake vortex flight test, as well as the simulator calibration flight test, the 737 was outfitted with a Flight Data Acquisition Unit and Flight Data Recorder (FDR) that recorded at a rate of 128 12-bit words per second, twice the rate of most FDRs. Cockpit control wheel, control column, and rudder pedal position

sensors were added to the airplane, and wired into the data recording system. In addition, a Boeing flight test recording instrumentation system, PADDs, was added to record data at higher sampling rates than FDRs.

A solid-state Cockpit Voice Recorder (CVR), with a two-hour recording capacity, was installed on the airplane. In addition, a breakout box was installed in order to route audio information to a Digital Audio Tape (DAT) recorder.

To record the wake's position relative to the 737, a video recording system utilizing seven cameras were installed on the airplane. A diagram indicating the position of each of the cameras is included in Attachment 3. The T-33 chase airplane also carried a video recording camera.

3. Flight Conditions Attempted

During the eight flights flown during the wake vortex test, approximately 160 individual flight conditions were attempted. A detailed explanation of each condition, used as instructions for the flight crew, is included in Exhibit 13X-F. A chronological listing of the conditions attempted during each flight is included in Attachment 4. In addition, a listing of conditions attempted, grouped by condition number, is included in Attachment 5.

4. Data Plots of Selected Wake Encounters

From the flight conditions attempted, a selected number of data plots from selected representative conditions were included in Attachment 6. Plots from all flight conditions and wake encounters will be included in the public docket at a later time. Plots included in this exhibit were constructed from PADDs data. Note that two plots are provided for each condition flown, pages A and B, respectively.

Simulator calibration flight conditions attempted during the wake vortex portion of the flight test are detailed and included in Exhibit 13X-B.

A video tape of segments of several selected flight conditions has been entered into the public docket as Exhibit 13X-I.

Further reduction remains to be accomplished on the data collected during the flight test. Data from the FAA's 727 and NASA's OV-10A must still be reduced and compared to the 737 data. Once all the 737 data has been reduced, it will be used as input to further refine the kinematic study. In addition, the collected data will be used as a comparison to FDR data from this accident.

Daily Summary of Wake Vortex Flight Test

Summary of Wake Vortex Flight Tests

(All Tests Flown from FAA Technical Center, Atlantic City Intl. Airport, New Jersey)

<u>#</u>	<u>Flight Test #</u>	<u>Date</u>	<u>Time</u>	<u>Weather Support</u>	<u>Comments</u>
1	19-06-1	Tues, 9/26	1:27	FDR	Hazard Flt; Video used for Press Con.
2	19-06-2	Tues, 9/26	0:34	FDR	Scrubbed due to incimate weather
3	19-07-1	Wed, 9/27	1:24	FDR	Delay - Ground Fog; good data taken
4	19-07-2	Wed, 9/27	1:32	FDR, OV-10	Delay - Slat Prox; vortices unstable
5	19-08-1	Thur, 9/28	1:59	FDR	Exc Data; vortices stable in a.m.
6	19-09-1	Fri, 9/29	2:36	FDR, OV-10	Exc Data; vortices stable; OV-10/727
7	19-09-2	Fri, 9/29	1:20	FDR	CVR Flight; vortices unstable
8	19-10-1	Sat, 9/30	1:58	FDR, Wallops Balloon	Exc Data; Flight over Wallops Is.

ATTACHMENT 2

Summary of B-737 Modifications

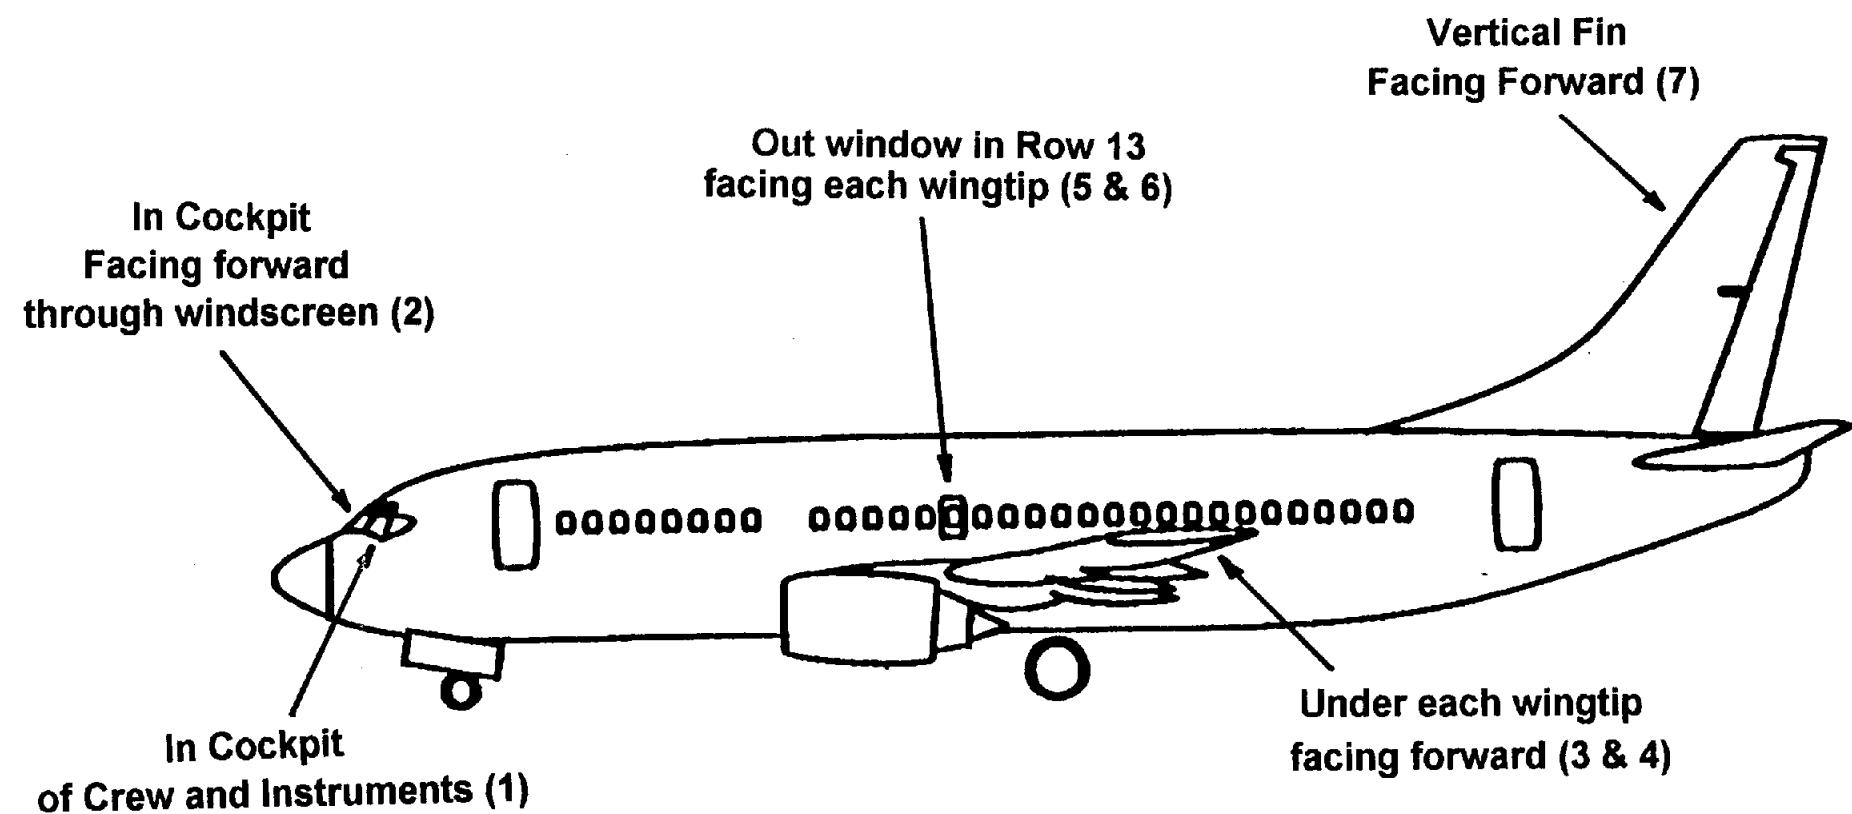

737 Modifications for Test

- 1) Solid State, 128 word/second FDR
- 2) Add Control Wheel, Control Column, and Rudder Pedal to FDR
- 3) Add 7503 lbs. Ballast
- 4) Flight test data recording system
- 5) 7 camera VCR recording system
- 6) Solid State, 2 Hour CVR
- 7) T-33 Chase w/ rear seat camera
- 8) Removal of seats for equipment and access
