Digital Flight Data Recorder Factual

Specialist's Report of Investigation
by Cassandra Johnson

A. INCIDENT

Location: Newark, NJ
Date: July 31, 1997
Time: 0131 Eastern Daylight Time(EDT)
Aircraft: McDonnell Douglas MD-11, N611FE
NTSB#: DCA97MA055

B. GROUP

Chairperson: Cassandra Johnson
National Transportation Safety Board
Member: Mr. John Fraley
Federal Express Corporation
Member: Mr. Shem Malmquist
Federal Express Pilots Association
Member: Mr. William Steelhammer
Boeing Commercial Airplane Group, Douglas Products Division

C. SUMMARY

On July 31, 1997, at 0130 eastern daylight time (EDT), Federal Express cargo flight 14, a McDonnell Douglas MD-11, N611FE, crashed while landing on runway 22R at Newark IAP, Newark, NJ. The airplane landed became airborne and touched down a second time. At some point during this sequence of events, portions of the right main landing gear structure failed and the right main landing gear collapsed. A fire broke out and destroyed the airplane. Visual flight rules (VFR) conditions prevailed at the time, and the two pilots and three other occupants of the aircraft received minor injuries. The instruments flight rules (IFR) flight originated at Anchorage, AK.

The digital flight data recorder (FDR), a Sundstrand Data Control model UFDR, serial number 2222, was removed from the main wreckage and sent to the Safety Board's laboratory in Washington, D.C. for readout and evaluation.

Using Safety Board's transcription equipment and computer software, a successful FDR readout was performed. Attachments I-1 to I-17 contain the FDR

parameter listing information for the accident airplane. The last 3 minutes (175¹ seconds to 355 seconds) of selected FDR data are presented in attachments III-1 to III-5 for the accident landing in graphical format. Selected FDR data in attachments IV-1 to IV-4 graphically show, in greater detail, the accident landing (335 seconds to 353 seconds). Attachments V-1 to V-27 comprise the tabular data for attachments III and IV. Lastly, attachments VI-1 to VI-3 contain a tabular listing of selected discrete parameters for the last 3 minutes (175 seconds to 355 seconds) from the accident landing. The cross hatched area in attachments III and IV represent the data interruption that occurred between 347.55 seconds and 349 seconds.

D. DETAILS OF THE INVESTIGATION

Section I - Description of Data

This model flight data recorder records aircraft data in a digital format on ¼-inch magnetic tape. The digital FDR records 64 separate 12-bit words of digital information every second from the Digital Flight Data Acquisition Unit (DFDAU). Each grouping of 64 words is called a subframe. A group of four subframes comprise one frame. Each subframe has a unique 12-bit synchronization (synch) word identifying it as subframe 1, 2, 3, or 4. The synch words are the first word in each subframe. The data stream is "in synch" when successive synch words appear at 64-word intervals. Each data parameter (for example altitude, heading, airspeed) has a specifically assigned word and bit location within the subframe. Attachments I-1 to I-17 comprise the parameter information as supplied by the Boeing Commercial Airplane Group Douglas Products Division. A minimum of the last 25 hours of operational data are retained on the recording medium. This is accomplished by erasing the oldest data and replacing it with the newest.

Section II - Examination of Recorder

The recorder box was destroyed by the post impact fire. The outer sleeve of the flight data recorder showed extensive thermal damage (see figures 1 and 2). The underwater locator beacon was torn off and not recovered with the recorder (see figure 2). The outside of the armored enclosure and the circuit boards showed extensive thermal damage (see figures 3 and 4). The inside of the armored enclosure showed no evidence of thermal damage or impact damage (see figures 5 and 6). During tape removal, it was discovered that the magnetic tape was adhering slightly to the four heads (two erase heads and two recording/write heads) due to thermal exposure. Therefore, four small indentations were evident once the tape was removed.

Section III - Readout and Evaluation

The digital FDR data were transcribed from the magnetic tape media to hard disk for further analysis using the National Transportation Safety Board's readout

¹ All times are FDR subframe reference number in seconds.

equipment. The transcribed data were reduced from the recorded binary values (0's and 1's) to engineering units (for example feet, knots, degrees, etc.) using conversion formulas obtained from the Boeing Commercial Airplane Group Douglas Products Division (see attachments I-1 to I-17). The actual conversion is accomplished by an automated process that incorporates the National Transportation Safety Board's computers and associated software. The accident landing was located during the transcription.

Examination of the Recorded Binary Values (0's and 1')

Examination of the recorded binary values (0's and 1's) indicates the FDR was receiving data from the DFDAU up to and including word 34 of subframe 347. At word 35 of subframe 347, the FDR recorded 480 0's (the FDU stopped sending data to the FDR) and then the FDR started recording 0's and 1's (the FDU was re-initializing). Approximately 560 bits after the FDU began re-initializing, the sync code identified with the first subframe was recorded and three full seconds (subframes 349, 350 and 351) of FDR data were recorded. At what should have been the synch code for subframe 352 was a non-synch code word and then the FDR recorded 35 words of 0's (the FDU stopped sending data to the FDR). The next word was the beginning of the erase gap (this is where the FDR had erased the oldest data so to write the newest data). The erase gap was approximately 8 seconds long and then the oldest data began.

Left Brake Pedal Position

After reviewing the FDR data, the left brake pedal position indicated a negative 11.7 degrees offset from neutral position during flight mode. Therefore, 11.7 degrees was added to the left brake pedal position.

Right Brake Pressure Position

After reviewing the FDR data, the right brake pressure position indicated approximately positive 195 pounds per square inch (psia) offset from neutral position during flight mode. Therefore, 195 psia was subtracted to the right brake pressure position.

Section IV - Plots and Data Printout

The last 3 minutes (175 seconds to 355 seconds) of selected FDR data are presented in attachments III-1 to III-5 for the accident landing in graphical format. Selected FDR data in attachments IV-1 to IV-4 graphically show, in greater detail, the accident landing (335 seconds to 353 seconds). Attachments V-1 to V-27 comprise the tabular data for attachments III and IV. Lastly, attachments VI-1 to VI-3 contain a tabular listing of selected discrete parameters for the last 3 minutes (175 seconds to 355 seconds) for the accident landing. The cross hatched area in attachments III and

IV represent the data interruption that occurred between 347.55 seconds and 349 seconds.

Enclosures:

- Attachments I-1 to I-17: FDR Parameter Information
- Attachments II-1 to II-3: Pictures of the FDR
- Attachments III-1 to III-5: Last 3 Minutes of Selected FDR Data in Graphical Format
- Attachments IV-1 to IV-4: Last 18 Seconds of Selected FDR Data in Graphical Format
- Attachments V-1 to V-27: Selected FDR Data in Tabular Format for Attachments III and IV
- Attachments VI-1 to VI-3: Selected FDR Discrete Data in Tabular Format

I-13

Explanations of Notes:

X/773: Denotes Sub-Subcom parameters. This sequence specifies the value (x) of the super frame counter (parameter 773). Ex: 10/773 == Super Frame Counter is 10 for this parameter.

MALU TYPE: Mode Annunciator Logic Unit multi-bit discrete composed of individual discrete bits from the annunciator logic unit that together relate to alpha-numeric expression. In cal, value-expression is list left to right starting at 0.

Ex: [0=] NODISP [1=] AP1
 [2=] AP2 [3=] APOFF

* extrapolated from the DFDAU analog input section of Report K1521 Rev G

CALCULATIONS:

Accelerometers:

$$\text{Resolution} = (|\text{high_range}| + |\text{low_range}|) / 2^n, \text{ where } n = \text{sig bits}$$

$$\text{Offset} = (0 - \text{e.u. 0VDC}) / \text{Resolution}$$

Example: Vertical Accel resolution = $(6.0 + 3.375) / 4096 = 0.002289$

Vertical Accel offset = $(0 - - 3.375) / .002289 = 1475$

4-11

**APPENDIX II
ERROR MESSAGES AND CLARIFICATIONS**

<u>PARA NO</u>	<u>TITLE</u>	<u>EXPLANATIONS & MESSAGES</u>
XXX*		PARAMETERS WHOSE PARAMETER NUMBER IS FOLLOWED BY AN ASTERIC "*" ARE THE "FAA REQUIRED PARAMETERS" CALLED OUT ON THE CURRENT AAO.
207 208	APU N1 APU N2	BOTH APU N-SPEEDS WILL DISPLAY AN ALTERNATING VALUE OF 0 AND 54 AT FOUR SECOND INTERVALS WHEN THE APU IS OFF. THIS CORRESPONDS TO THE "NO DATA" MESSAGE FROM THE DFDAU AND IS THEREFORE NOT AN INDICATION OF AN ANOMALY WITH THE APU.
100	LOWER RUDDER POSITION	OCT 312 FCC-1. THE SIGN CONVENTION IS REVERESED FROM NORMAL FLIGHT TEST CONVENTION OF UP & TO THE RIGHT IS POSITIVE. FOR THIS PARAMETER, A/C NOSE LEFT (SURFACE TEL) IS A POSITIVE DEFLECTION.
101	UPPER RUDDER POSITION	OCT 312 FCC-2. THE SIGN CONVENTION IS REVERESED FROM NORMAL FLIGHT TEST CONVENTION OF UP & TO THE RIGHT IS POSITIVE. FOR THIS PARAMETER, A/C NOSE LEFT (SURFACE TEL) IS A POSITIVE DEFLECTION.
106	STABILIZER POSITION 1	OCT 315 FCC-1. THE SIGN CONVENTION IS REVERESED FROM NORMAL FLIGHT TEST CONVENTION OF UP & TO THE RIGHT IS POSITIVE. FOR THIS PARAMETER, A/C NOSE DOWN (SURFACE TED) IS A POSITIVE DEFLECTION. NOTE THAT THIS IS A DIFFERENT CONVENTION THAN THE ELEVATORS WHICH FOLLOW THE CONVENTIONAL SYSTEM OF POSTIVE A/C NOSE UP (SURFACE TEU).
107	STABILILER POSITION 2	OCT 315 FCC-2. THE SIGN CONVENTION IS REVERESED FROM NORMAL FLIGHT TEST CONVENTION OF UP & TO THE RIGHT IS POSITIVE. FOR THIS PARAMETER, A/C NOSE DOWN (SURFACE TED) IS A POSITIVE DEFLECTION. NOTE THAT THIS IS A DIFFERENT CONVENTION THAN THE ELEVATORS WHICH FOLLOW THE CONVENTIONAL SYSTEM OF POSITIVE A/C NOSE UP (SURFACE TEU).
