### Aircraft Accident/Incident Report No.: <u>121229</u>

## ACCIDENT SYNOPSIS

The NTSB preliminary report stated that the aircraft crashed near Lakeside California. The aircraft was on a personal cross-country flight which had originated from Montgomery Field, San Diego, CA. 9 minutes after takeoff, Witnesses reported seeing the airplane coming out of the clouds rotating until it impacted the ground. There was no post-impact fire.

Aircraft Damage:	Substantial
Injuries:	3 Fatal

#### SUMMARY AND ANALYSIS OF FINDINGS

The crushing damage to the spinner dome showed evidence of contact with a blade counterweight and piston. The spinner damage clearly indicated that the blades and piston were in the feather position at the time the spinner was crushed.

The blades did not have any clear indications of rotational scoring and the blades did not have any twisting to suggest power or rotation at impact.

### CONCLUSIONS

The propeller was in the feather position.

There were no discrepancies noted that would preclude normal operation. All damage was consistent with impact damage.

## **PROPELLER TEARDOWN REPORT**

Date of Investigation:	January 29-30, 201	3
Location:	Hartzell Propeller II Piqua, Ohio	nc.
Propeller Model:	HC-B3TW-3X with Experimental Prope	
Representatives:	Dan Boggs Tom McCreary Zoe Keliher	Hartzell Propeller Inc. Hartzell Propeller Inc. NTSB

#### General Comments:

This type propeller is a 3-blade single-acting, hydraulically operated, constant speed model with feathering and reversing capabilities. Oil pressure from the propeller governor is used to move the blades to the low pitch (blade angle) direction. Blade mounted counterweights and feathering springs actuate the blades towards the high pitch direction in the absence of governor oil pressure. The propeller incorporates a Beta mechanism that actuates when blade angles are lower than the flight idle position.

The blades are of aluminum construction. The hub and blade clamps are steel. Propeller rotation is clockwise as viewed from the rear.

The propeller was not removed from the engine. The propeller was not disassembled. Aside from the blade damage, the hub and pitch change components were intact and very lightly damaged. Because of this, a complete teardown was not performed as there would not be any meaningful impact marks/blade angle indications to be found.

Reverse:	-10 <u>+</u> 0.5	degrees
Flight idle:	13.8 <u>+</u> 0.1	degrees
Feather:	84.0 <u>+</u> 0.5	degrees
Counterweight	2.0 <u>+</u> 1.0	degrees

## Aircraft Accident/Incident Report No.: <u>121229</u>

## Service History:

Logbooks were not available. Service history is unknown. Decals on the propeller blades indicated that the propeller had been serviced by Flightcraft in Portland, OR.

Hub Serial Number:none foundFactory No.:C0820A

**Blade Model:** T8290 (not physically observed) The propeller was not disassembled and the blade serial numbers were not observed.

### "As Received" Condition:

The propeller remained on the engine. The spinner dome had been removed. All three blades were in the feather position. One blade had fractured in an area of sharp bending; the fractured portion was recovered.

The propeller hub, blade clamps, and pitch change mechanism were intact except two screws that retain a link arm pin had been sheared. The sheared screw heads were imbedded in the spinner dome.

### Spinner Dome:

The spinner dome had been crushed on one side with no frontal crushing. A blade counterweight had punctured the spinner dome; the spinner puncture occurred when the blade/counterweight were in the feathered position. The spinner dome was also crushed over the piston with two fractured screw heads imbedded in the spinner dome. The two screws are part of the piston assembly that retain one of the link arms to the piston.

The spinner dome was re-installed to show the alignment of the dome and piston and indicated that the piston was in the feather position when the spinner was crushed.

### Spinner Bulkhead:

Intact and unremarkable

### **Propeller Cycling:**

Not attempted

## Aircraft Accident/Incident Report No.: <u>121229</u>

### Engine/Propeller Mounting:

The mounting flange and bolts were intact and unremarkable. The carbon block had disengaged from the beta feedback collar. The carbon block was intact and remained attached to the engine linkage.

#### Blade/Clamp Rotation:

None of the blades had rotated in the clamps.

#### **Pitch Stops:**

Reverse Pitch Stop: The reverse pitch stop was not observed.

Feather Stop: The feather stop was not observed.

**Beta rods:** The beta mechanism (beta rods, flight idle stops, feedback collar) were intact and unremarkable.

#### Piston:

The piston was intact and unremarkable except that two screw heads (that retain a piston link pin) had been sheared.

#### Link Arms:

Intact and unremarkable

### Cylinder:

Not observed

### Feathering Spring Assembly:

Not observed

### Pitch Change Rod:

Not observed

#### Clamps and Counterweights:

All three blade clamps, link screws, and counterweights were intact and unremarkable.

Clamp serial numbers: 1: EM15100

2:	EM15095
3:	EM15092

### Aircraft Accident/Incident Report No.: <u>121229</u>

#### Hub Unit:

The hub was intact and unremarkable.

#### Blades:

Blade # 1 was sharply bent forward and fractured at ¼ radius. The outer 8 inches of the tip had multiple small bends in the lead and trail edges. It had a large gouge/tear in the trail edge at mid-blade. The blade was not twisted.

Blade # 2 was bent aft approximately 90 degrees at mid-blade. The blade was not twisted.

Blade # 3 was bent forward approximately 30 degrees with a large radius bend. The outer 4 inches of the tip was bent further forward with multiple small bends in the tip area. The blade was not twisted.
