MATERIALS LABORATORY FACTUAL REPORT

Report No. 11-030

A. ACCIDENT

Place : San Bruno, California
Date : September 9, 2010
Vehicle : Natural Gas Transmission Pipeline
NTSB No. : DCA10MP008
Investigator : Ravi Chhatre, RPH-20

B. DOCUMENT ATTACHED

Presentation by the Federal Bureau of Investigation regarding the laser scanning process used to document the condition of the pipe pieces at the National Transportation Safety Board's Training Center. The presentation was delivered at the 2011 SPAR International Conference in Houston, Texas, on March 23, 2011.

Need to Know:

Location:

Size:

Weight:

Color:

LS selection:

Pre-deployment:

- Initial phone call disclosed object location, size and weight
- Power accessibility
- Location access Security
- Custom build frame for scanner and create targets.

“Site contained necessary items to move pipes.”

Approach to task:

Custom Built Frame
Created the day
before.

Surphaser 25HSX LS

Scanned a total of
41 positions;
(2 test scans)
used 39 in
approximately
8.5 hours.

(This included hoisting
and moving 3 pipe
sections to scan
bottoms.)

**Targets Placed for Registration
utilizing the Intensity Scans
During Alignment
in Polyworks**

- **Top** - from frame scan upside down
- **Sides** - from tripod mount
- **Bottom** - move pipes to scan from floor

Basic Scanning Positions

Overall Scale

Carl Adrian &
William Atkins

Custom Built Frame

**Tripod
Scanning**

- Time for initial alignment and modeling: 40 hours
 - 32 bit machine and 64bit machine utilized
 - Time needed for making watertight models with minimal knowledge: 3 weeks
 - Difficulties found with working with broken pipe edges and thickness.

Working with the Point Cloud Data

Side scan

(Intensity Image)

Side Scan

(Point Cloud with Intensity image
turned on)

- To see the targets; utilize the Intensity image on point clouds

**Alignment of scans
