In cases to where a visit to the meter set is required in order to establish service for a new tenant, the meter is subject to a visual inspection for abnormal operating conditions. This is discussed in more detail in Washington Gas O&M Manual section 4053. Establishing service to a new occupant may cause the meter to be set, reset or changed. For example, an operational problem with the meter may be identified in the course of executing the turn-on order, requiring a meter change. Washington Gas O&M section 5102 describes the procedure for setting, resetting, and turning on meters. If the regulator is subject to an interruption in service during the course of establishing service to the customer, it is tested and/or adjusted according to O&M section 5121. The Washington Gas O&M Manual has previously been provided in its entirety.
