

LOWER SKIN PANEL - WING CENTER TANK

CW-215
C-251
GREEN

This is a small section of skin panel and lower right hand S.O.B. splice that extends from S-22 to the front spar and extends to RBL 116. This segment still remains attached to the front spar terminal fitting (CW-503) and portions of the outbd wing front spar and side of body rib.

The paddle fittings at S-22 and S-23 remain attached to the lower splice and skin panel and are deflected upwards at the inb'd end. Portions of the stringer ends remain attached to the paddle fittings. The inb'd fracture edge of the skin panel at RBL116 is deflected upwards. A piece of fairing support rod is attached to the lower surface.

There is no soot on the inside of the skin but is sooted on the exterior. See the Fire and Explosion Group notes for full documentation.
