

SIDE OF BODY RIB - RIGHT WING - WING CENTER TANK

CW-302

C-2279

GREEN

This portion of the side of body rib is the vertical flange of the double plus chord that attaches to the rib web from the rear spar to S-15C. This portion is still attached to the upper fuselage and right upper wing (ref CW-105).

The double plus chord vertical flange has 3" of side of body rib web still attached and has the upper corner splice intact at the rear spar terminal fitting. The only stiffener end that remains attached is at the midspar. The vertical flange of the double plus chord and the web remain flat and vertical.

There is no soot on the outbd side of this segment but some on the inbd side. See the fire and explosion group notes for complete documentation.
