Group Chair's Factual Report - Attachment #4

Woodward Test Results for the FCU and PT Governor

December 8, 2023

AN EAGLE PARTNER

P/N: 1-170-780-01 Model #: TA-7 S/N: 672AS1023 W.O. #: AI1003

Tested for standard day flows only JE

TASK	TECHNICIAN INITIALS & DATE	INSPECTOR STAMP & DATE
Date: <u>NOV 17 2022</u> Part List: <u>100770AS</u> Operator: <u>[Signature]</u>	<u>NOV 17 2022</u>	
Test Performed I.A.W.: <u>73-20-03</u> Stand: <u>LECT 319</u>		

A. GENERAL (PDF PAGE 461)

- Service limits in this section can be used for a second source testing and service evaluation of field returned units. Service limits are not to be used for overhaul or reconditioning. All overhaul requirements apply during service testing except for the service limits included in this section. Service limits are used stated above to eliminate minor test equipment correlation problems. Units meeting service testing requirements are considered functionally serviceable with accrued service time. They may not be zero timed.
- On units meeting service testing and local inspection and quality requirements, it is recommended that information pertinent to the following areas be reviewed and evaluated prior to release of unit for reinstallation on engine:
 - Consideration of remaining serviceable time
 - Physical condition and seal integrity
 - Evidence of internal contamination
 - Fuel control log entries
 - Service data
 - Data on suspected problem areas

B. STANDARD SETTINGS AND CONDITIONS (PDF PAGE 461)

- The following conditions must be set and maintained during final test procedures, unless otherwise specified:

N ₁	Limits per test requirements ± 4 RPM
P _B	4 ± 2 PSIG
P ₁	29.92 ± 0.05 inches of mercury (Hg) absolute
P _N	200 ± 20 psig (1379 ± 137.9 kPa) at 300 ± 10 psig at 900 pph
Quad	100 ± 0.5 degrees, using test quadrant STD62480
T ₁	59 ± 3°F
W _r	Limits per test requirement
IGV Lever	For units with IGV indicator plates, at 60 degree or greater mark. For units without the IGV indicator plate, between CCW position and horizontal position
Solenoid	In automatic system operation position
Igniter Line	Line closed
Fuel Inlet Temperature	65° to 85°F
Test Fluid	Calibrating fluid, Type 2 (ref. MIL-PRF-7024, Type II)

TASK	TECHNICIAN INITIALS & DATE	INSPECTOR STAMP & DATE
C. SERVICE LIMITS TESTING (PDF PAGE 462)		
1. Conduct service limits test procedures under the same conditions, and in the same manner as final test procedures found in the Final Test Data Form, OAW-F-200-058. The following tests differ from those in the final test procedures as indicated, except for air-bleed limits. They are the same as in the Final Test Data Form, OAW-F-200-058.	NOV 17 2022 [Redacted]	
2. Preliminary Leak Test (with governor mounted on regulator) (PDF page 462)	NOV 17 2022 [Redacted]	NOV 17 2022 OAW INSP 114
a. Reduce outlet pressure (P_B) to zero by shutting down N_1 drive and N_2 drive. Set inlet temperature at 55°F to 85°F.	[Redacted]	NOV 17 2022 OAW INSP 114
b. Increase inlet pressure (P_B) 45 to 50 PSIG. Measure leakage at N_1 and N_2 seal drains during several one-minute periods.	NOV 17 2022 [Redacted]	NOV 17 2022 OAW INSP 114
c. Set N_1 speed at 4300 RPM and N_2 speed at 4600 RPM, with inlet pressure (P_B) at 45 to 50 psig. Close the throttling valve to obtain 600 to 620 PSIG. Measure discharge pressure leakage at N_1 and N_2 seal drains during several one-minute periods.	NOV 17 2022 [Redacted]	NOV 17 2022 OAW INSP 114
d. At no time must the combined leakage from N_1 and N_2 seal drains exceed one cc per minute. No other external leakage is permitted.	NOV 17 2022 [Redacted]	
2. Emergency (Manual) Flow Schedule (PDF page 442)	NOV 17 2022 [Redacted]	
a. Apply 14 volts DC and switch solenoid to emergency position. Switchover (fuel flow) should occur in one second maximum. Shut off current to ensure solenoid is mechanically held in emergency position.	[Redacted]	
b. Run emergency flow schedule (Table 2) using standard conditions, except as specified. NOTE: Use emergency maximum flow valve wrench (STD64917) when adjusting maximum flow valve (201, Figure 107).	NOV 17 2022 [Redacted]	
c. Run lines one through three, setting quadrant and N_1 speed in the increasing direction. Then record corresponding W_f values.	NOV 17 2022 [Redacted]	
d. Make a hysteresis check at line two, setting quadrant in the decreasing direction.	NOV 17 2022 [Redacted]	
e. Switch solenoid back to automatic system, at test completion. Shut off current to ensure solenoid is mechanically held in automatic position.	NOV 17 2022 [Redacted]

TASK						TECHNICIAN INITIALS & DATE	INSPECTOR STAMP & DATE
TABLE 2: EMERGENCY (MANUAL) FLOW SCHEDULE (DC=14V)						NOV 17 2022 [Redacted]	
Line	N ₁ ± 10	Quad + 0.5	Fuel Flow				
			Minimum	Actual	Maximum		
1	1800	21	105	126	123		
2	2600	55	186	217	226		
3	4100	100	675	690	725		
3. High Pressure Relief Valve Test (PDF page 463)						NOV 17 2022 [Redacted]	NOV 17 2022 OAW INSP 114
a. Set standard conditions and N ₁ speed at 3500 ± 20 RPM for a fuel flow (Wf) of 620 ± 26 PPH.							
b. Fully close throttling valve (13, Figure 704). The high-pressure relief valve must maintain at a differential pressure of 850 ± 50 PSIG (P _{N1} minus P _B) at no flow.						[Redacted]	NOV 17 2022 OAW INSP 114
4. Stopcock Valve Test (PDF page 463)						NOV 17 2022 [Redacted]	NOV 17 2022 OAW INSP 114
a. Set standard conditions, and then set N ₁ speed at 0 RPM. Set quadrant at zero degree and inlet pressure (P _B) at 10 ± 5 PSIG.							
b. Disconnect throttling valve (13, Figure 704) from P _N port of fuel regulator. Measure leakage at discharge port for several one-minute periods.						[Redacted]	NOV 17 2022 OAW INSP 114
c. At no time shall leakage at P _N port exceed two drops per minute. If leakage exceeds this limit, shims (122 and 124, Figure 107) must be reduced in thickness, each by the same amount (refer to Figure 519 in the Assembly section of 73-20-30 Manual.						[Redacted]	NOV 17 2022
5. Acceleration and face cam schedule—T ₁ at 59°F (PDF page 463): Table 3 in the Final Test Data Form, OAW-F-200-058, is replaced by Table 1 in this form. All other steps in the performance of the test must be followed in the same sequence as the Final Test Data Form, OAW-F-200-058.						NOV 17 2022 [Redacted]

TASK	TECHNICIAN INITIALS & DATE	INSPECTOR STAMP & DATE
<p>d. With these conditions set, the edge of the feedback cam arm must align with the edge of the IGV boss on the cover, farthest from the air-bleed cover, within ± 15 degrees. If this position cannot be obtained, re-index the feedback cam arm on its shaft as required, and recheck the null position.</p> <p>NOTE: Indexing one tooth on the spline will change the feedback cam arm approximately 10 degrees. A range of ± 2 teeth in position from the nominal position is permitted. The scribe line on the shaft is in line with the open end in the feedback cam arm when the arm is in the nominal position.</p>	<p>NOV 17 2022</p> 	
<p>e. When the pressure gauge readings have been stabilized and the null position of the feedback cam arm has been obtained, shut down the test equipment and disconnect both IGV gauges.</p>	<p>NOV 17 2022</p> 	
<p>f. Set N_1 speed at 550 ± 4 RPM, and set P_1 at 29.92 inches H_g absolute. Move the feedback cam arm from full counterclockwise position to a horizontal position, checking fuel flow during the cam arm travel. Fuel flow must remain between 60 and 74 PPH. Record actual fuel flow.</p> <p>Actual Fuel Flow: <u>59</u></p> <p>CAUTION: DO NOT ROTATE FEEDBACK CAM ARM BEYOND THE HORIZONTAL POSITION.</p>	<p>NOV 17 2022</p> 	<p>NOV 17 2022</p> 
<p>g. Rotate feedback cam arm counterclockwise from the horizontal position and leave in that position for the remainder of final test.</p>	<p>NOV 17 2022</p>

<p><i>NOV 17 2022</i></p> <p>Date: _____ Part List: <u>652AM2506</u> Operator: <u>[Signature]</u></p> <p>Test Performed I.A.W.: <u>75-2002</u> Stand: <u>LTCT 319</u></p>	<p><i>NOV 17 2022</i></p> <p>[Redacted]</p>	<p>[Redacted]</p>
<p>1. GENERAL (PDF PAGE 109)</p>		
<p>The following steps contain servo valve break-in, component adjustment, and final test of the assembled power turbine governor (PTG-3 and PTG-1 Series). The procedures outlined include all necessary shimming and adjustments required to meet test requirements.</p> <p>The servo valve break-in and adjustment for PTG-3 Series Governor with TA-7 Regulator may be completed using the Governor Flow Test Fixture or a calibrated TA-7 Regulator. Section 2 describes the procedure using the flow test fixture. Section 3 describes the procedure using a calibrated TA-7 Regulator.</p> <p>NOTE: Final adjustment and test is not required for governors shipped as spares.</p>	<p>[Redacted]</p>	<p>[Redacted]</p>
<p>2. OPTIONAL METHOD FOR BREAK-IN AND ADJUSTMENT OF PTG-3 SERIES GOVERNOR WITH A TA-7 REGULATOR</p>		
<p>A. Test set-up:</p> <p>1. Testing of governor setting may be performed with the governor assembled to a Model TA-7 regulator P/N: 107700 or 106500, which is known to be operable and within limits. The fuel control unit is mounted on fuel control test stand, LTCT319, to simulate engine mounting (with quadrant STD63973 installed). Necessary indicating and measuring devices are connected into the test system (refer to applicable Main Fuel Regulator Overhaul instructions manual). Calibrating fluid Type 2 (reference MIL-PRF-7024, Type II), at a temperature of 70° F to 80° F, must be used during testing. Fuel should be filtered with a 10-micron filter before entering the control inlet (Figure 703 (test set-up), PDF page 119).</p> <p>Equipment required:</p> <ul style="list-style-type: none"> • Calibrated TA-7 P/N: 100770A3 or later configuration or P/N: 106500A1 or later configuration • Fuel control test stand LTCT 319 • Test quadrant STD63973 • Torque adapter STD65561 • Calibrating fluid MIL-PRF-7024, Type II 	<p><i>NOV 17 2022</i></p> <p>[Redacted]</p>	<p>[Redacted]</p>
<p>2. General TA-7 regulator settings and conditions: For all calibration and cycling tests, the following fixed variables will be maintained, unless instructed otherwise:</p> <ul style="list-style-type: none"> • Manual operation switchover valve in automatic position • Fuel inlet temperature 75 ±5° F • Fuel pressure at control unit inlet: 2 to 10 PSIG • Fuel control outlet pressure set to provide 300 ±10 PSI at 900 PPH flow rate • Igniter line closed • P₁ air pressure: 29.92 ±0.10 in. hg. abs. • T₁ temperature at sensor bulb: 59 ±2° F • Throttle lever at 100° ±2° position • N₁ speed: 4000 ±20 RPM 	<p><i>NOV 17 2022</i></p> <p>[Redacted]</p>	<p>[Redacted]</p>

TASK	TECHNICIAN INITIALS & DATE	INSPECTOR STAMP & DATE
<p>B. Preparation for break in: Vent the entrapped air in the governor through the power turbine upper cover as follows:</p> <ol style="list-style-type: none"> 1. Install the plastic or equivalent bleed line after removing vent plug (20, 20A). 	<p>NOV 17 2022 [Redacted]</p>	
<ol style="list-style-type: none"> 2. Set the regulator at the standard conditions listed above, and run the unit until a steady stream of fuel is flowing from the bleed line. 	<p>NOV 17 2022 [Redacted]</p>	
<ol style="list-style-type: none"> 3. Start the N₂ governor drive. 	<p>NOV 17 2022 [Redacted]</p>	
<p>C. Servo break-in procedure: This procedure is required for all new servo assemblies not previously run in an N₂ governor.</p> <ol style="list-style-type: none"> 1. Set standard conditions listed in Section 3, Step A.2. 		
<ol style="list-style-type: none"> 2. Back out both minimum and maximum stop adjustment bolts (70, 75, Figure 1001, PDF pages 135-137). 		<p>NOV 17 2022</p>
<ol style="list-style-type: none"> 3. Run the N₂ governor at a speed of 1000 RPM, and move stop lever through its full travel range. Fuel flow should increase and decrease at least 300 PPH as the stop lever is moved from stop to stop. 	<p>[Redacted]</p>	
<ol style="list-style-type: none"> 4. Set and lock manual shaft stop lever (85) in position; fuel flow is approximately in the middle of the fuel flow range. <p>NOTE: If manual shaft stop lever (85, Figure 1001, PDF pages 135-137) can be moved through its full travel range while fuel flow remains constant, test cover STD64779 must be installed if it was removed. Use upper cover hardware to secure test cover. Run governor at 1000 RPM, and adjust test cover adjusting screw to obtain a fuel flow change of at least 300 PPH when the manual shaft stop lever is moved.</p>	<p>N/A no break in needed</p>	
<ol style="list-style-type: none"> 5. Break in governor as follows, ensuring it is approximately in the middle of the fuel flow range at each break-in speed: <ul style="list-style-type: none"> • Run the governor at a speed of 1000 RPM for a period of 30 minutes • Run the governor at a speed of 2500 RPM for a period of 30 minutes • Run the governor at a speed of 4000 RPM for a period of 30 minutes 		
<p>D. Governor component adjustment:</p> <p>NOTE: Item numbers refer to Figure 1001 (PDF pages 135-137), unless otherwise specified.</p> <ol style="list-style-type: none"> 1. Equipment required is the same equipment listed in Section 3, Step A.1., this section. 	<p>NOV 17 2022 [Redacted]</p>	

TASK	TECHNICIAN INITIALS & DATE	INSPECTOR STAMP & DATE
2. Procedure:		
a. Remove unit upper cover assembly or test cover by removing screws (40,45) and washers (50). Remove pin (165, 165). Then remove lever and roller assembly (200, 200A). Carefully remove spring guide (205, 205A, 205B, 205C).	NOV 17 2022 [Redacted]	
b. Retain the same thickness of shims as installed during assembly. Re-assemble lever assembly and upper cover assembly.	NOV 17 2022 [Redacted]	
c. Install test fixture quadrant (STD63973) over governor manual control shaft (100, 100A) as shown in Figure 702, PDF page 112).	NOV 17 2022 [Redacted]	
d. After governor and test equipment are set up, set the fuel regulator to standard conditions, but do not start N ₂ test drive. Vent entrapment air through top cover port through the plastic bleed line.	NOV 17 2022 [Redacted]	
e. Start test stand N ₂ drive. Drive must run clockwise when looking at test stand drive.	NOV 17 2022 [Redacted]	
f. Set quadrant pointer to zero degree. Increase speed slowly to 4023 ±4 RPM. Move quadrant pointer quadrant until fuel flow is 300 ±10 PPH. At this fuel flow reading, the pointer must be on the high-speed side and within 7 ±2 degrees of centerline (zero-degree mark) toward the high-speed stop (Figure 702, PDF page 112).	NOV 17 2022 [Redacted]	
g. If pointer registers too far on the low side, remove a quantity of shims (210) to bring within limits. If pointer registers too far on the high side, add shims to qualify limits.	NOV 17 2022 [Redacted]	
3. Adjustment settings maximum and minimum stops:		
a. Set low speed adjustment as follows:		
i. Set speed to 3270 ±4 RPM. Move pointer on low side until fuel flow is 400 ±5 PPH.	NOV 17 2022 [Redacted]	
ii. Screw in low speed stop adjustment bolt (75) flush with stop lever (85).	NOV 17 2022 [Redacted]	
iii. Secure adjustment bolt with check nut (80), while holding fuel flow at 400 ±5 PPH. Torque check nut 20 to 30 inch-pounds, using torque adapter STD65561. Torque Wrench #: <u>0117821173</u> <i>EXP 6-6-23</i>	NOV 17 2022 [Redacted]	

TASK		TECHNICIAN INITIALS & DATE	INSPECTOR STAMP & DATE	
b. Set high speed stop adjustment as follows:				
i. Bring speed up to 4450 ±4 RPM, and set fuel flow to 400 ±5 PPH by moving pointer on high side as shown in Figure 702 (PDF page 112).		MOV 1 7 2022 [REDACTED]		
ii. Screw in high speed stop adjustment bolt (70) to touch manual shaft stop lever (85). Secure bolt iwht check nut (80), making sure not to disturb setting. Torque check nut 20 to 30 inch-pounds, using torque adapter STD65561.		MOV 1 7 2022 [REDACTED]		
iii. Run Line 1 and 2 of Table 1 to ensure they fall within limits. If not, remove unit upper cover assembly.		MOV 1 7 2022 [REDACTED]		
TABLE 1: DROOP SCHEDULE (LEVER AT MAXIMUM SPEED STOP)				
LINE	N ₁ SPEED	N ₂ SPEED	WF-PPH	
			MIN	MAX
1	4000	4235-4291	735	765
2*	4000	4440-4460	392	408
3**	2000	3745-3755	125	155
*Hysteresis limit: ±8 PPH when settling same N ₂ speed; ±12 RPM when setting same fuel flow (Wf).				
**Run with lever against low speed stop.				
iv. Back off machine screw (175) lever and roller assembly, and use lever adjusting screw (170) to adjust fuel flow.		MOV 1 7 2022 [REDACTED]		
NOTE: Screw in lever adjusting screw to decrease fuel flow. Back out adjusting screw to increase fuel flow.				
v. Reassemble unit upper cover assembly, test, and repeat procedure in Section 3, Step D.3.b.iii. until fuel flow is within limits. Reassemble as outlined in Assembly.		MOV 1 7 2022 [REDACTED]		
NOTE: The requirements set forth in Section 3, Steps D.2.f; D.3.a; and D.3.b. must be simultaneously within limits before proceeding.				
vi. Make both increasing and decreasing speed runs at Line 2 in Table 1. At increasing speeds, all readings must fall within limits listed.		MOV 1 7 2022 [REDACTED]		

TASK	TECHNICIAN INITIALS & DATE	INSPECTOR STAMP & DATE
vii. Readings on the decreasing speed run must be within readings on the increasing speed run at the set point only. If hysteresis is not within limits specified, do not proceed further until cause of hysteresis is eliminated.	M JV 17 2022 [REDACTED]	
c. Ensure pointer total travel from low speed stop adjustment to high speed stop adjustment is 60 ±4 degrees.	M JV 17 2022 [REDACTED]	
d. With N ₂ speed set at 4270 ±30 RPM and the manual shaft stop lever against the high-speed stop adjustment bolt, vary P _s pressure from 100 to 700 PSIG. Fuel flow must not move more than 42 PPH.	M JV 17 2022 [REDACTED]	
e. Set manual shaft stop lever at high-speed, and set N ₂ speed to 4270 ±20 RPM. Apply P _B pressure of 50 PSIG—leakage from drain port must not exceed 0.4 cc per minute. Reduce speed to 0 RPM, and maintain P _B pressure of 50 PSIG—leakage from drain port must not exceed 0.4 cc per minute. NOTE: The drain lines at the N₂ drives should be so arranged that the drain leakage can be observed at any time throughout the test. Observe to ensure no governor leakage exists except at the governor (N₂) seal drain. At no condition should the drain leakage exceed 0.4 cc per minute.	M JV 17 2022 [REDACTED]	M JV 17 2022 OAW INSP 114
f. Complete final test on calibrate TA-7 fuel regulator per Section 4.	M JV 17 2022 [REDACTED]	
3. FINAL GOVERNOR TEST (MOUNTED ON FUEL CONTROL)		
<p>NOTE: Final testing of the PTG-3 and PTG-1 Series governors will be divided into two segments for clarity. The following step, A, applied to both series.</p> <p>NOTE: Throughout tests, observe to ensure no governor leakage exists except at the governor (N₂) seal drain. At no condition should the drain leakage exceed 0.4 cc per minute. Drain lines at the N₂ drives should be arranged; so, the drain leakage can be observed at any time during test.</p>		

TASK	TECHNICIAN INITIALS & DATE	INSPECTOR STAMP & DATE
<p>A. Set-up and equipment: CAUTION: ENSURE CALIBRATING FLUID, MIL-PRF-7024: TYPE II, USED FOR TESTING HAS NOT DETERIORATED. CALIBRATING FLUID, PARTICULARLY IN SMALL VALUME, SELF-CONTAINED TEST STANDS, TENDS TO BECOME EXTREMELY OXIDIZED IN A RELATIVELY SHORT TIME (FOUR TO SIX MONTHS). OVEREXPOSURE OF NITRIL PACKING, TYPES MS9021 AND MS29513, TO OLD CALIBRATING FLUID WITH A HIGH OXIDATION POTENTIAL CAN RESULT IN HARDENING AND CRACKING OF THOSE PACKINGS SUBSEQUENT TO OVERHAUL. A SIMPLE TEST TO DETERMINE THE ACCEPTABILITY OF THE CALIBRATING FLUID MAY BE PERFORMED PERIODICALLY. SOAK A SAMPLE NITRILE PACKING IN CALIBRATING FLUID FOR 24 HOURS AT 158°F FOR 24 HOURS AT 158°F. DRY THE PACKING AT 158°F FOR 24 HOURS. MODERATE HARDENING OF THE PACKING IS ACCEPTABLE, BUT CRACKING, EXTREME HARDENING, OR OTHER DAMAGE IS REASON TO CHANGE THE CALIBRATING FLUID. UPON COMPLETION OF THE FINAL TEST, THOROUGHLY FLUSH THE GOVERNOR WITH GRADE 1010 LUBRICATING OIL TO REMOVE ANY RESIDUAL CALIBRATING FLUID.</p> <p>1. Final testing of governor setting is performed with the governor assembled to a Model TA-2B, TA-2G, TA-2S, or TA-7 regulator, which is known to be operable and within limits. The fuel control unit is mounted on fuel control test stand, LTCT319, to simulate engine mounting (with quadrant STD63973 installed). Necessary indicating and measuring devices are connected into test system. (Refer to applicable Main Fuel Regulator Overhaul Instructions Manual.) Calibrating fluid Type II (reference MIL-PRF-7024: Type II), at a temperature of 70°F to 80°F, must be used during testing. Fuel should be filtered before entering the control inlet with a 10-micron filter. If, during testing, it's not possible to obtain test data at the set points, stops may be reset, provided the manual shaft stop lever travel between low and high-speed stops remains 60 ±3 degrees. Only slight adjustment should be required. If large adjustment is required to meet set points, the governor must be recalibrated as outlined in Section 2, Step D or Section 3, Step D. (See Figure 703 (PDF page 119) for actual test set-up installation.) After governor and equipment are fully set up, start boost pump, and set P₈ pressure to 10 PSIG. Vent the entrapped air in the governor through the upper cover as follows:</p> <p>NOTE: Test values given in the following tests are the test values obtained when using a TA-7 fuel regulator.</p> <p>a. Install plastic bleed line in governor after removing plug (20, 20A, Figure 1001, PDF pages 135-137).</p>	<p>MSV 1 7 2022</p> <p>[Redacted]</p>	<p>[Redacted]</p>
<p>b. With the governor mounted on the main fuel regulator running at 3900 RPM, 100-degrees quadrant setting, start the governor drive.</p>	<p>MSV 1 7 2022</p> <p>[Redacted]</p>	<p>[Redacted]</p>
<p>c. Set governor at high-stop, and gradually bring N₂ governor speed to 4450 RPM. Run unit for 10 minutes prior to making any governor adjustments.</p>	<p>MSV 1 7 2022</p> <p>[Redacted]</p>	<p>[Redacted]</p>

TASK	TECHNICIAN INITIALS & DATE	INSPECTOR STAMP & DATE												
<p>d. During the last five minutes of the running period, cycle the governor manual shaft stop lever from low cam position to high cam position a minimum of 10 times to ensure proper venting of air from servo valve area.</p>	<p>NOV 17 2022 [Redacted]</p>													
<p>2. General control settings and conditions--The following control settings and conditions must be maintained during testing, unless otherwise specified:</p> <ul style="list-style-type: none"> • Manual operation switchover valve in automatic position • Fuel inlet temperature 70°F to 80°F • Fuel pressure at control unit inlet (P_B) 3 ±3 PSIG • Fuel control outlet pressure (P_N) is set to the following setting: <ul style="list-style-type: none"> ◦ 300 ±10 PSIG at 900 ±10 PPH for TA-7 models <p>Discharge pressures are set by setting an N₁ speed to obtain the specified fuel flow, and then setting the outlet pressure (P_N) using the valve at the discharge port. Leave the valve at the discharge port at this setting for the balance of testing, unless otherwise specified.</p> <ul style="list-style-type: none"> • Air pressure (P₁) 29.92 ±0.05 inches of mercury absolute • Temperature at sensor bulb (T₁) 57°F to 61°F • Igniter line closed 	<p>NOV 17 2022 [Redacted]</p>													
<p>B. Test speeder spring shimming: Set speed at 4023 ±4 RPM, adjust governor manual stop lever to obtain a fuel flow (W_f) of 300 ±10 PPH.
